

# Inferences for Regression (Chapter 23)

Patrick Frenett and Nicholas Horton ([nhorton@amherst.edu](mailto:nhorton@amherst.edu))

June 17, 2016

## Introduction and background

This document is intended to help describe how to undertake analyses introduced as examples in the Fourth Edition of *Intro Stats* (2013) by De Veaux, Velleman, and Bock. More information about the book can be found at [http://wps.aw.com/aw\\_deveaux\\_stats\\_series](http://wps.aw.com/aw_deveaux_stats_series). This file as well as the associated R Markdown reproducible analysis source file used to create it can be found at <http://www.amherst.edu/~nhorton/sdm4>.

This work leverages initiatives undertaken by Project MOSAIC (<http://www.mosaic-web.org>), an NSF-funded effort to improve the teaching of statistics, calculus, science and computing in the undergraduate curriculum. In particular, we utilize the `mosaic` package, which was written to simplify the use of R for introductory statistics courses. A short summary of the R needed to teach introductory statistics can be found in the `mosaic` package vignettes (<http://cran.r-project.org/web/packages/mosaic>).

Note that some of the figures in this document may differ slightly from those in the IS4 book due to small differences in datasets. However in all cases the analysis and techniques in R are accurate.

## Chapter 23: Inferences for Regression

### Section 23.1: The population and the sample

```
library(mosaic); library(readr)
BodyFat <- read_csv("http://www.amherst.edu/~nhorton/sdm4/data/Body_fat_complete.csv")
dim(BodyFat)
```

```
## [1] 250 16
```

```
glimpse(BodyFat)
```

```
## Observations: 250
## Variables: 16
## $ BodyDensity <dbl> 1.0708, 1.0853, 1.0414, 1.0751, 1.0340, 1.0502, 1....
## $ PctBF <dbl> 12.3, 6.1, 25.3, 10.4, 28.7, 20.9, 19.2, 12.4, 4.1...
## $ Age <int> 23, 22, 22, 26, 24, 24, 26, 25, 25, 23, 26, 27, 32...
## $ Weight <dbl> 154.25, 173.25, 154.00, 184.75, 184.25, 210.25, 18...
## $ Height <dbl> 67.75, 72.25, 66.25, 72.25, 71.25, 74.75, 69.75, 7...
## $ Neck <dbl> 36.2, 38.5, 34.0, 37.4, 34.4, 39.0, 36.4, 37.8, 38...
## $ Chest <dbl> 93.1, 93.6, 95.8, 101.8, 97.3, 104.5, 105.1, 99.6,...
## $ Abdomen <dbl> 85.2, 83.0, 87.9, 86.4, 100.0, 94.4, 90.7, 88.5, 8...
## $ waist <dbl> 33.54331, 32.67717, 34.60630, 34.01575, 39.37008, ...
## $ Hip <dbl> 94.5, 98.7, 99.2, 101.2, 101.9, 107.8, 100.3, 97.1...
## $ Thigh <dbl> 59.0, 58.7, 59.6, 60.1, 63.2, 66.0, 58.4, 60.0, 62...
## $ Knee <dbl> 37.3, 37.3, 38.9, 37.3, 42.2, 42.0, 38.3, 39.4, 38...
## $ Ankle <dbl> 21.9, 23.4, 24.0, 22.8, 24.0, 25.6, 22.9, 23.2, 23...
## $ Bicep <dbl> 32.0, 30.5, 28.8, 32.4, 32.2, 35.7, 31.9, 30.5, 35...
## $ Forearm <dbl> 27.4, 28.9, 25.2, 29.4, 27.7, 30.6, 27.8, 29.0, 31...
## $ Wrist <dbl> 17.1, 18.2, 16.6, 18.2, 17.7, 18.8, 17.7, 18.8, 18...
```

We can confirm the coefficients from the model on page 645.

```
BodyFatmod <- lm(PctBF ~ waist, data=BodyFat)
coef(BodyFatmod)
```

```
## (Intercept)      waist
## -42.734134      1.699972
```

## Section 23.2: Assumptions and conditions

We can regenerate the output and figures for the example on pages 647-651.

```
msummary(BodyFatmod)
```

```
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept) -42.73413      2.71651  -15.73  <2e-16 ***
## waist       1.69997      0.07431   22.88  <2e-16 ***
##
## Residual standard error: 4.713 on 248 degrees of freedom
## Multiple R-squared:  0.6785, Adjusted R-squared:  0.6772
## F-statistic: 523.3 on 1 and 248 DF,  p-value: < 2.2e-16
```

```
rsquared(BodyFatmod)
```

```
## [1] 0.6784564
```

```
confint(BodyFatmod)      # see page 755
```

```
##              2.5 %    97.5 %
## (Intercept) -48.084497 -37.38377
## waist       1.553603   1.84634
```

```
# Figure 23.4
xyplot(PctBF ~ waist, xlab="Waist (in.)",
       type=c("p", "r", "smooth"), data=BodyFat)
```

```
# Figure 23.5
xyplot(resid(BodyFatmod) ~ waist, xlab="Waist (in.)",
       type=c("p", "r", "smooth"), data=BodyFat)
```

```
# equiv of Figure 23.6 note that Figure 23.6 refers to the diamonds dataset
xyplot(resid(BodyFatmod) ~ fitted(BodyFatmod), xlab="Predicted values",
       ylab="Residuals",
       type=c("p", "r", "smooth"), data=BodyFat)
```

*# Figure on bottom of page 650*  
`xqqmath(~ resid(BodyFatmod))`

**Section 23.6: Confidence intervals for predicted values** We can reproduce Figure 23.12 (page 662) using the `panel.lmbands()` function.

```
xyplot(PctBF ~ waist, xlab="Waist (in.)",
       panel=panel.lmbands, lwd=2, cex=0.2, data=BodyFat)
```

```
Craters <- read.csv("http://www.amherst.edu/~nhorton/sdm4/data/Craters.csv")
dim(Craters)
```

```
## [1] 168  4
```

```
Craters <- mutate(Craters,
  logDiam = log(Diam.km.),
  logAge = log(age..Ma.))
Cratermod <- lm(logDiam ~ logAge, data=Craters)
favstats(~ logAge, data=Craters) # note example in book has n=39
```

```
##      min      Q1  median      Q3      max      mean      sd  n missing
## -9.808177 3.608111 4.82391 5.94985 7.783224 3.761161 3.464722 168      0
```

```
confpred <- predict(Cratermod, interval="confidence")
intpred <- predict(Cratermod, interval="prediction")
```

```
## Warning in predict.lm(Cratermod, interval = "prediction"): predictions on current data refer to _future_ data
```

```
select(Craters, -Name) %>% head(., 3)
```

```
##           Location Diam.km. age..Ma.  logDiam
## 1      Kansas, U.S.A.    0.015  1.0e-03 -4.199705

## 3 -3.23616841 -5.798897 -0.6734403
```

**Section 23.7: Logistic regression** The Pima Indian dataset example is given on pages 663-667.

```
Pima <- read_csv("http://www.amherst.edu/~nhorton/sdm4/data/Pima_Indians_Diabetes.csv")
Diabetes <- filter(Pima, BMI>0) # get rid of missing values for BMI
bwplot(BMI ~ as.factor(Diabetes), data=Pima)
```

```
pimamod <- glm(Diabetes ~ BMI, family="binomial", data=Pima)
f2 <- makeFun(pimamod)
xyplot(Diabetes ~ BMI, data=Pima)
plotFun(f2, add=TRUE)
```

```
msummary(pimamod)
```

```
## Coefficients:
##           Estimate Std. Error z value Pr(>|z|)
